

Natural disasters, Global warming and the World

A natural disaster is a major adverse event resulting from natural process of the earth; examples are floods, hurricanes, tornadoes, volcanic eruptions, earthquakes, tsunamis and other geological processes.

In addition to these, floods, droughts, change in temperature, blow of hot/cold winds, excessive snowfall/rainfall in a particular region and there may be few more fallouts due to these geological changes.

All these factors merge into a Global warming.

At present natural calamities depicts that it is on the increase as compared to a decade or two back. It is due to manmade and due to unforeseen, which is a threat to life and property. It is estimated that if the present scenario continuous for few more decades then these natural calamities will double every 5 years in geometrical progression. It is certain that after about 20 - 25 years such happenings may occur on an average in any part of the world, daily with its multiplied magnitude.

One can imagine that what will be the future of our coming generations, our children, our grand children, our great grand children and their children. We should appreciate for this commendable work of ours which we are doing at present by spreading pollution etc. By this we are destroying our lifeline that is water, air from both ends and producing unimaginable pollution caused by various reasons and creating such a climatic conditions which is direct and indirect threat to human life and for the existence of humanity.

We can imagine ours and ours children future very well in this scenario? Due to multiple increases in pollution in the past few years, in the name of development is a threat and warning for the existence of human life. It is expected that particular in big cities after 15 to 20 years, every child born will be either sick or handicapped. In that situation we can imagine what a wonderful life it would be?

Now there is a need to spread awareness to protect our lifeline. This awareness will be a Saviour for the generations to come. Only need is to understand its importance and to do a little bit in this regard may be a drop of water in the sea/ocean. We are sure that this will be a matter of pride tomorrow, when we will see our generations blooming like a flower by eradication of threats caused by this Global warming.
